New chimeric proteins containing human growth hormone fragment, used insulin; precursor; growth hormone; chaperone; intramolecular; folding; conformation; chimeric protein; cleavable; recombinant; LTD (TONG-) TONGHUA GANTECH BIOTECHNOLOGY AAY42861 standard; protein; 150 AA 98WO-CN00052 98W0-CN00052 Chimeric protein, SEQ ID 7 (first entry) WF:: 1999-610839/52. production; yield Homo sapiens W09950302-A1 31-KAR-1998; 31-KAR-1998; 19-JAN-2000 07-00T-1999 Synthetic AAY42861; Gan 2; AA14286 \$\text{\$\

```
This sequence represents a chimeric protein, which contains on Neterminal tragment of human growth bormone (hos) of the sequence also in AAV42856, a cleavable peptide luser (AAV42857), and a histories insults precursor comprising insulin, a and 8 chains (AAV42859). The LOB portion of the chimeric protein acts as an intramolecular chaperone (1MT) is the insulin precursor enabling to fold correctly free cleavable peptide linker has a C-terminal Arg reside which enables the hos protein of the chimeric protein to be removed after rolation has taken place. Production of recombinant buman insulin via an healthy profine chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     interactions among the fusion proteins, thus allowing folding of the fused insuling precursor at commercially useful lith concentrations. The procedural steps of cyanogen broaded cleavage, oxidative sulphitolysis and related purification steps can thus be eliminated, along with the use of high concentrations of mercaptan or the use of hydrophobic absorbent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                62 TPSNREETQQKSNLELLRTSLLLLQSWLEPVQLGTGPRFVNGHLCGSHLVEAAYLVCGER 120

The INC sequences not only protect insulin sequences from intracelliar destractions by a microornanism heat. But also protect the folding of the fased insulin procursor, fact that solubility of the fusion protein and decrease the interrolection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 MEPTIPLSRLFDNAMLRAHRIHQLAFDIYQEFSBAYIPKFOKYSFLQNPQISLSFSBSIP 60

This sequence represents a chimeric protein, nGH-mini-proinsuin.

This chimeric protein contains an N-terminal fragment of human growth horzone (hGH) of the sequence given in AAV2855, a cleavable peptide linker (AAV2857), and a human insulin precursor comprising insulin as an intranolecular chapterone (IMC) for the insulin precursor, as an intranolecular chapterone (IMC) for the insulin precursor, and intranolecular chapterone (IMC) for the insulin precursor, and intranolecular chapterone (IMC) for the insulin precursor, and high protein of the cheavable poptide linker has a chimanial and residue which enables the hGH portion of the cheavable poptide linker by chimaric protein to be removed after folding dostone of the chimaric protein can provide human insulin with correctly linked cystoine bridges with the provide human insulin with correctly linked cystoine bridges with the fusion form of the fuscalinar degradation by a microorganism host, but also promote the fusion proteins and decrease the intermolecular interactions among the fusion proteins, thus allowing folding of the fused insulin precursor at commercially useful high concentrations. The procedural steps of cyanorgen bromide classics allowing dolding of the fused insulin precursor at commercially useful high concentrations. The procedural steps of purification steps can thus be eliminated, along with the use of high concentrations of mercaptan or the use of hydrophobic absorbent resins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 TPSNREETQQKSNLELLRISLLLIQSWLEPVQLGTGPRFVNQHLCGSHLVEALYLVCGER 120

This sequence represents an N-terminal fragment of human growth hormone (high) which is a component of a chimeric protein (AAV1286) which also contains a human insulin precursor (AAV12869). The EGH portion of the chimeric protein acts as an intramolecular chapteone (IMC) for the insulin precursor, enabling it to fold correctly. A cleavable peptide linker with a C-terminal Art regidue (AAV12867) anables the build portion of the chimoric protein to be removed affectly influence take primers. Production of recembinant bursa insulin via an host-profits it of merric protein can provide human insulin with currectly linked eyseline bridges with fewer necessary procedural steps, and lenne resulting is a higher yield of human insulin. The EMC sequences not only protect insuling a sequence from intracellular degradation by a microransian best. But, also prorote the folding of the lased insulin precursor, localizate the containing containing containing the intermolecular.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; anti anglogenic; prolactic; pracenta; lactogen; hPL; anologenosis; qrowth hormone, hGn; hGH-V; capillary endothelia; cell proliteration; placental vascularisation; pregnancy; treatment; anglodente disease; tumour; inhibitor; malignan; anglodibroma arteriovencus malformation; arthritis; atherosclerotic plaques; corneal graft neovascularisation; arthritis; atherosclerotic plaques; corneal graft neovascularisation; grandiation; glaucoma; ocular; uveils; flacture; Gsler-Weber syndrome; psorlasis; flarophasia; sclaroderma; Kaposi's sarcoma; vascular adhesionulcer; leukaemia; reproductive disorder; contraceptive agent;

mondaturing vascularization of a patient, a practicus, in particusary, and perfect of the perfec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Irom 10 to 150 consequitive aminous and support progress werest from 10 to 150 consequitive aminous selected from the N-terminal and burners placental lactogem (hPL), human growth hormone (hGH), growth hormone variant (hGH-V), or human prolactin. Such peptides (i) inhibit capillary endothelial cell proliteration and organisation (ii) inhibit angiogenesis in chick chorioallantote membrane and (iii) binds to at least one specific receptor which does not bind an intact full length hGH, hPL, prolactin or hGH-V. The invention also describes a method for diagnosing a probable abnormality of placental vascularisation during programmer. The peptides can be used for treating an angiogenic disease in a subject, for inhibiting tumour formation or growth in a patient or for modulating vascularisation of a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 MFPTIPLSRLFDNAMIRAHRLHQIAFDTYQEFEEAYIPKEOKYSFLQNPQTSLSFSESIP 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention consists of a vector contg. a fusion protein which is formed by ligating, downstream of a promoter, hGH or a deriv. (prof. formed by subtstn. of Met.14 with Leu) and a foreign protein. Stability of the vector in the nost is greatly increased so the protein yield is higher.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant vector contq. fusion protein - consisting of human growth hormone or deriv. ligated to foreign protein, for stability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          16;

This invention describes nevel human anti-signatoric peptides nectived from the U to 150 conscentive unito acids selected from the N-terminal and from 10 to 150 conscentive unito acids selected from the N-terminal and to for human placental lactogen (hi), human around the N-terminal and to for human placental lactogen (hi), human around the N-terminal and to form the peptides (i) inhibit capitlary endothelial celiproliferation and organisation (i) inhibit and operation of the N-terminal and the new form the favoration as describes a method to high projection or nGH-Y. The invention also describes a method to high and appropriate abnormality of placental vascularisation during pregnatory. The peptides can be used for treating as angiogenic disease in a subject, for inhibiting tumour formation or stown in particular, the peptides can be used for preventing or treating as angiogenic disease peptides can be used for preventing or treating as an inparticular, the peptides can be used for preventing or treating as an inparticular, the peptides can be used for preventing or treating as a reperior of a grid or and of a particular and a sterior of a mediciproma, arteriorers mailton artifitie such as reperior of a mediciproma, arteriorers mailton artifitie such as reperior such as hypertrophic scars or keloid scars, neovascular alauceas, contact tumour, uveitis, non-union fractures, Osler-Weber syndrome, psoriasis, pyogenic glaucoma, retrolental (ibroplasia, scheroderma, solid tymours, pyogenic glaucoma, retrolental (ibroplasia, scheroic varicose micers, leukaemia, and reproductive disorders such as folliandar and inteal cysis and choriocarchoma. They can also be used as contraceptive acents, DNA encoding the peptides can be used in gene therapy. The measurement of abnormal levels of N-termical fragments of hGH-V, prolactin or hBC can be used in assays for impairment of vascular development ussociated with pre-celumpsia, intracterine growth retardation, and placental arthritis, atherosclerotic planues, correal graft necessorialisation. decayed wound nealing, proliferative retinopathy such as diametic retinopathy, macular degeneration, granulations such as those correring in hacmophilic joints, inappropriate vascularisation in wound realing dysfunction

0 inuman growth hormone segment, used at the N-terminal of a fusion protein, which contains a thrombin recognition site, and human beta nerve growth factor (beta-NGF) at the C-terminal. Beta-NGF can be used to control geriatric dementia and other nervous disorders, and can be released from the folsion protein by incubation with thrombin (see AAN90577-8, AAP91034, AAP91299). 61 IPSNREETQQKSNLELLRISELLIQSWLEPVQF-LRSVFANSLVYGASDSWYDLLKDLE 119 61 TPSNREETQQKSNLELLRISLLLIQSWLEPVQLGTGPRFVNQHLCGS------HLV 110 1 MPPIPLSRIFDNAMLKAHRLHQUAFDTYQFFEEAYIPKEOKYSFLONPQTSLCFSESIP 60 1 MFPTIPLSRLFDNAMLRAHRLHQLAFDTYQEFEEAYIPKEOKYSFLQNPQTSLSFSESIP 60 1 MEPTIPLSHIFDNAMIRAHRIHQIAFDTYQEFEEAYIPKEQKYSFLQNPQTSLSFSESTP 60 Gaps w human nerve growth factor gene encoding lusion protein having cleavage site for thrombin, useful for treating geriattic 16; 0) Length 192; Length 140; geriatric dementia; nervous disorders; human nerve factor. The invention relates to identify.og an extrost active demain to a rection of Known amino acid sequence in a parent polyment.de e.g. barts at with homeone (MdH) which has been cloned and has a pre-identified thologist of contact with a turge when the partial polyment is a cative folded form and the lateration is responsible for the hologistal activity expression of Known and acid sequence of polymeptide strature in the region. If known acid sequence of high with the armino acid sequence of a majorate polymeptide (e.g. prolaction of known amino acid sequence of a majorate polymeptide (e.g. prolaction phasental lactorary or porchae around the hormone) which has at least 15% homeory with high alpha-cathon corridinates within about 2.3.5 acquence, where any interaction of the analogue sequence, where any interaction of the analogue sequence. Where any interaction of the analogue sequence, where any interaction of the analogue sequence, where any interaction of the analogue into NNA encoding as analogue by prepride sequence from the sequence from the sequence for analogue into NNA encoding as analogue sequence interaction of the sequence of mologue into NNA encoding the full length kill, and expressing the polymetride (c) contaction (d) reporting series the polymetride (c) contaction (d) reporting series the polymetride (d) contaction (d) reporting series the polymetride (d) represented (
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (e) comparing the difference between activity of the first and second segment-substituted polypeptides as an indication of the location of the unknown active domain in nGH. The method is useful for determining
                                                                                           acid sequence by substituting adalog sequents into the parent polypeptide is useful to determine the relationship between structure
                                                                 identifying active domains within cloned polypoptides of known action
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           the relationship between stricture and function of known polypeptide sequences. The present sequence is that of human growth hormone mulant substituted with residues from an HGH analogue (prolacin, placental lactogen or pording growth hormone).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note: The present sequence is not shown in the specification but was created by the indexer using the mature NGH sequence and information
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (b) and (c) with a second analogous polypeptide search; and(e) comparing the difference between activity of the first at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ABG94977 standard: Protein; 191 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Buman growth hormone mutant Y163A.

perpendicular the biological activity comprising (a) comparing the amino acid sequence or polypeptide structure in the region of known amino acid sequence of polypeptide structure in the region of known amino acid sequence or polypeptide structure in a region of known amino acid sequence or polypeptide (b) polypeptide (e.g. prolactin, placental lactogen or porcine growth hormone) which has at least 15% homology with high alpha-carbon coordinates within about 2-3.5 angstroms of hormone) which has a least 15% homology with high carbon coordinates within about 2-3.5 angstroms of hormone within the traget. Is afficent from traget interaction of the analogue with the target is different from traget interaction with high analogue with the target is analogous polypeptide segment from the analogue into DNA encoding the full length high, and expressing a segment-substituted polypeptide; (c) contacting the segment: substituted polypeptide (c) contacting the segment: and second analogous polypeptide segment: and second analogous polypeptide segment; and second analogous polypeptide segment.

segment-substituted polypoptides as an indication of the location of the unknown active domain in hGH. The method is useful for determining the relationship between structure and function of known polypoptide sequences. The present sequence is that of human growth hormone mutant substituted at functionally important residues and used in

The present sequence is not shown in the specification but was aby the indexes using the mature hGH sequence and information

contained in the specification.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the fotal score distribution.
